

GHG emission crawler

From input CSV to the Excel report. Claude Code is the runtime; the filesystem is the database.

Accent fill = start & end · dashed accent box = per-company loop (runs inside every worker)

How to read it.

- The left spine is the flow from `input CSV` to `deliverables` ; the dashed box is the loop that runs once per company, inside every worker.
- The branch after **judge** is the decision rule: figures visible on a page → screenshot; otherwise → download the report PDFs.
- The right panels are the actual tech stack and the properties the design buys you. Only Firecrawl is a paid external service — everything else is local and free.
